

Orgonomy and environment

The environment in which we live largely depends on the natural functioning of the atmosphere that, by its cycles of energy charge and discharge, allows favourable conditions for life sustainment. Frequency and intensity of such atmospheric cycles, functionally identical to the periods of good and rainy weather, can vary from an area to another and have substantially local characteristics. In case this pulsation is inhibited by external agents, such as pollution created by industrial and nuclear activities, or by electromagnetism, or even, as hypothesed by some, by influences of cosmic origin (solar spots and lunar activity), it can gradually modify until to significantly decrease its influence.

According to the kind of atmospheric block that can occur either drought first and, with the prolongation of the block, aridity and desertification then, or a considerable increase of precipitation leading at long term to flooding and inundation of the hit areas may develop.

Interventions, aimed at restoring the natural atmospheric cycle of energy charge and discharge, can recover the cyclical functions of the atmospheric parameters and bring back the favourable conditions for a better sustainment of the environment and the life of the populations involved. However, this kind of solution may be temporary and does not solve the problem in case the main causes of the environmental upheaval are not removed.

A method to restore the natural pulsation of the atmosphere is *cloudbusting*. It was conceived at the beginning of the '50s by the Austrian natural scientist and Freud's pupil Wilhelm Reich. It is based on the assumption that the atmosphere and the cosmos are full of energy. Its presence was discovered by Reich, first studying the behaviour of human beings, showing that it flows inside the organism, and then studying the origin of life, finding it everywhere. He wanted to call it orgone energy or simply orgone.

Cloudbusting is based on the use of an instrument called *cloudbuster*. The device may, whether used according to particular operative protocols, restore the natural atmospheric pulsation, whatever can be the blocking conditions. Secondary effects of the use of this instrument may be the production of rain or snow, creation or dissipation of clouds or cloud systems, creation of winds, and decrease of temperatures. All of these in turn can make possible to reduce pollution, to reduce drought and to combat desertification expansion, to cite only few outcomes. The method does not need chemicals or particularly complex instrumentation as indeed is required by other methods such as *cloudseeding*.

Today there is more and more conviction that *cloudbusting* can give a large contribution not only to functionally restore the natural functioning of a blocked area but also to combat the present global expansion of desertification. James DeMeo, Director of the *Orgone Biophysical Research Lab* (Oregon, Usa), states as follows¹:

"...While i do not wish to oversimplify or exaggerate, from nearly 30 years of field work with the cloudbuster, I have come to appreciate the tremendous power and capacities of the underlying *orgone energy continuum* which the device stimulates. This same energy continuum governs our weather to its fundament, and also plays an important role in both biological and cosmological functions. It once was recognised as the *life-energy* by ordinary perceptive people within a hundred different cultures, and also used to be described in the context of the *cosmological ether of space* - which contrary to popular myth, was factually detected and proven repeatedly to exist by physicists, from the 1920s into the modern times. And the cloudbusting method itself had been examined and proven scientifically years ago, in field studies reviewing official weather data applying classical scientific methods of analysis..."

Since 1952 Reich tested *cloudbusting* in more than 100 experiments, obtaining all the time the planned results, i.e. making rain and even greening desert areas such as the Arizona's. After Reich's death (1957), the most important research activities were conducted by Richard Blasband, Robert Morris, Courtney Baker, John Schleining and Jerome Eden.

These scientists, starting from the '60s, performed numerous experiments in the most arid areas of the Usa, aimed at verifying the effectiveness of Reich's technology, and obtaining in the majority of the tests the planned results. Most of these results were published both on scientific Journals, such as the *Journal of Orgonomy*, and *Pulse of the Planet*, and books out by independent researchers. These experiments were performed following all the time strict scientific methods. Satellite images were used, all the most critical atmospheric parameters were monitored, and the results evaluated by statistical methods. In 80% of the interventions precipitation, reduction of drought and desertification, abundant snow in mountainous areas, and diversion of hurricanes' path were obtained, as per initial plan.

Amongst those that presently carry out researches in this field, the most important is James DeMeo. He has been performing, with the help of skilled collaborators such as Bernd Senf, Carlo and Aurelio Albini, Matt Ryan and the same Richard Blasband, experiments in the most arid and desert areas of the planet, such as the desert of Arizona, Namibia, Eritrea, and in Israel. In all these cases he succeeded to recover the natural functioning of the atmosphere and to produce abundant rain.

In Eritrea rain was so abundant, after 30 years of drought, that artificial lakes formed in the desert, close to the Aswan dam. DeMeo reports his 30-year activity of research and experimentation with the *cloudbuster* as follows¹:

".... Personally speaking, I have seen cloudbusting operations which stimulated large rivers of atmospheric moisture to veer into the cores of hard drought regions, whereupon tired grey haze-clouds swelled up into large blue-white cumulonimbus, spreading rains across hardpan and cracked earth. I've seen regions dry for decades become significantly wet after only a few days of carefully-undertaken cloudbusting operations, with flowing creeks and streams, and reservoirs sometimes filled to overflowing. I've stood at the edge of some of the driest spots on the planet - the

Kalahari, the Syrian and Negev Deserts, the Namib, and the great Sahara Desert - and in all cases, the cloudbusting method proved its worth.

Stagnant and hazy, overheated atmospheres were replaced, usually within a short stretch of a few days of hard work, with the most magnificent and mighty of rainclouds, pregnant with rain, and pouring forth life-giving moisture across the parched landscape. A dramatic blossoming of wildflowers, grasses and sometimes new lakes were observed in barren stretches of previously dead, dusty and parched land where only the most skimpy of rains had previously fallen, and where nobody could have believed it possible. In the parched "Holy" lands, suffering under the dual plagues of social and environmental disasters, members of our small group, now called *CORE Network*, have witnessed dramatic transformations of the atmosphere from dry to wet, hot to cool, and with greened hills and lakes and snow-capped peaks appearing in places previously completely barren and arid. We had to pinch ourselves to be certain we were not dreaming, or had not been magically transported from the hard desert to some green and snowy-lush landscape typical of the Swiss Alps or Rocky Mountains.

During our most ambitious undertaking, a five-year project in Eritrea, Africa, large sections of the Sahel were greened and made verdant, and annual food imports to that small nation were reduced by tens of millions of dollars. Giant new lakes - too large to see the opposite shore - appeared as if by miracle within the heart of the Sahara, as overflow from the Nile, and after only a few summers of consistently-applied cloudbusting work....."

In addition to DeMeo, few people are presently doing worldwide research and experimentation with *cloudbusting*. Amongst these we can find Trevor Constable. His most important operational activities are focused above all to reduce pollution in smoggy areas of California and to make rain in some Asian countries. Besides, he performs researches aimed at reducing the dangerousness of the instruments today used.

However, it is mandatory to give a look also to the reasons why *cloudbusting* is not accepted yet by traditional science and has not had the diffusion it would deserve to date notwithstanding all the positive results obtained. Presently, traditional science is based on Einstein's assumption of a Universe empty and void of energy, that is in clear contrast with Reich's discoveries. Perhaps, this is the main reason why Reich's *cloudbusting* has not been appreciated as it should be for its importance and enormous applications.

DeMeo, concluding his foreword to the book *Wilhelm Reich and the Healing of the Atmospheres*, discusses the issue as follows¹:

"... As a consequence, we now have the technical means to put a stop to droughts and heat-waves, and to green the harshest deserts of the world, assuming that this is what humanity desires. Technically, I can say with confidence, this is now possible. We have this possibility within our hands. Socially, however, we still face tremendous and oftentimes insurmountable obstacles, given the emotionally-armored condition of modern Homo normalis, who loves and creates deserts far more rapidly than most anything else...."

It is also very important to point out that the use of technologies like this must be accurately and articulately regulated at global level. This is exceedingly required to avoid nations, that do not have a specific regulation on issues such as those related to interventions into the atmosphere aimed at modifying a whatever physical parameter, can create chaotic weather and climate variations by wild *cloudbusting*. And this can be potentially dangerous for the equilibrium of the environment and life in general even much far from the location where the interventions were carried out.

Besides, such regulations should be developed according to a multidisciplinary approach in such a way this technology can be effectively used to restore the natural pulsation of the atmosphere without creating traumas or damages to the existing ecosystems and to the populations living in the areas subjected to the interventions.
